

Map 23 Tomis-Olbia-Chersonesos

Compiled by David Braund, 1995
with the assistance of Diane Braund

Introduction

The region to the north and west of the Black Sea has received substantial archaeological attention over many years (see especially Koshelenko 1984, supplemented by Hind 1992; cf. 1994; and, on a wide range of issues, Vinogradov 1997). More recently it has been the subject of underwater investigations, which, with some support from geologists, have encouraged dramatic reconstructions of much of the coastline (notably Agbunov 1985; 1987; cf. Hind 1983, 72). It seems that the Black Sea was somewhere between three and thirty ft. lower in the first millennium B.C. (the so-called Phanagorian regression). That, however, is a huge range, while it should also be noted that much of the argument for sea-level changes depends upon archaeological work and speculations, so that there is a danger of circular argument. Yet some rise in sea-level since antiquity is clear, not only at large sites like Olbia, but also at smaller sites, like Kutsurub (numbered site 25; Marchenko 1983). Reconstructions of the coastline are therefore needed, but the process of recovering the ancient shore has not yet advanced far enough to permit great confidence in detail. In particular, while some of the problems of identifying ancient sites may be solved by a better understanding of physical changes since antiquity, recourse to reconstructions must remain a last resort for the time being. More often, the primary difficulty is the reconciliation of conflicting ancient testimony. Accordingly, much of the shoreline of this map—from the R. Danube westwards to Taphros (modern Perekop)—is marked as uncertain, but reconstructions have not been adopted wholesale.

The deltas of the rivers present the most complex areas of change. The Danube delta has evidently changed since antiquity, but the nature of that change is known only in very broad terms. Much speculation has been encouraged by the fact that ancient writers count the branches of the delta with different results (Agbunov 1979, 123; 1987, 142-44; Panin 1983; 1983a; cf. Parroni 1984, 281; Corcella 1993, 271-72; Silberman 1995, 59). While they variously refer to three, five, six or seven mouths, there are now three principal ones. By the Roman period, the figure of seven seems to become more or less standard: its value is indicated by the fact that each of the seven is named (though not by all sources, nor always in the same way). However, the delta was evidently large and marshy enough to encourage different conceptualizations of its lower course. Tacitus (*Germ.* 1) mentions six mouths emptying into the Black Sea, with a seventh into a marsh, while Strabo (7.3.15) pays attention to the relative size of the mouths and sets them out accordingly. Ptolemy seems confused (Brandis, RE 4 cols. 2117-22; cf. Treidler, RE 23 cols. 1400-1404; TIR Romula). Limited geological research (Panin 1983; 1983a), and the largely concordant accounts of the Roman period, constitute the basis of the provisional reconstruction of the delta on the map.

In making this reconstruction, particular attention has been paid to the description by Pliny (*NH* 4.83), who gives names not only for the mouths of the Danube, but also for some of the “islands” formed by the channels of the delta. Attention may be drawn to the merits of the version presented here, beyond its broad accordance with the irreconcilable evidence of our sources and its attention to such geology as we know. First, the most southerly branch of the delta leads into the saline marsh (ancient Halmyris) beyond which the city of Histria is located. In that sense, Histria (“city of the Hister”) was not as far removed from the great river as even the best maps tend to suggest. Second, the curiously named Pseudostoma is seen to be indeed a “false mouth,” in the sense that it seems to offer a useful passage to or from neither south nor north; in effect, the courses of the neighboring channels make it redundant for the traveler. Third, the version presented here accounts, too, for the fact that the Borion (“northern”) Stoma was not the most northerly mouth of the Danube delta; rather, Psilon Stoma was (though the two were sometimes equated). Even so, as the map shows, Borion Stoma could readily be envisaged as such, with the channel to its north (Psilon/Thiagola) passing into the sea through a marsh (Thiagola), rather like the most southerly channel.

The delta of the R. Dnieper (ancient Borysthenes) presents a separate set of problems. The river itself has been changed by the modern construction of a reservoir in the north-east corner of the map, an area rich in Scythian

tumuli. The map thus attempts to reproduce the earlier course of the river, with its many channels and islands. It is at the mouth, however, that changes are most significant for the classical world and also most problematic. Although I adopt a fairly conservative stance, it has been cogently argued that in antiquity a branch of the lower Dnieper cut straight through the peninsula facing the mouth of the R. Bug (ancient Hypanis) and debouched into a much reduced Yagorlytskiy Bay; consequently, Ivanovka 5 (numbered site 64), for example, lay far inland from the shore of that bay (Kryzhitskiy 1989, 15, 97 and 153). At the same time, it is argued, the “Wooded Sea” (*Hylaeum Mare*) to the south-east of the Bug mouth was substantially smaller than today.

The lower course of the R. Dniester (ancient Tyras) has likewise been the subject of reconstruction, though evidently with less support from geological research. The fact that Ophioussa is sometimes identified by our sources with Tyras, and at others is presented as a separate location (Kacharava 1991, 205-206), has encouraged the suggestion that it was an island, now engulfed by the lower course of the Dniester (Agbunov 1981; cf. Hind 1983, 78; Kacharava 1991, 206-207). Such problems are familiar in the western Black Sea region (see, for example, Gocheva 1996 on Dionysopolis, Map 22 F5). Until there has been a rigorous study of the geology of the lower Dniester, a more cautious solution seems preferable—for example, that Ophioussa became Tyras in the middle of the fourth century B.C. (Kacharava 1991, 205-207).

Be that as it may, rather more ancient testimony has combined with sustained archaeology on the lower Dniester, and still more on the Lower Bug, to produce substantial knowledge. Many of the sites here are so close to one another that they are shown on the map with a single symbol, as a cluster; where such a group of sites is large, the location of the cluster symbol on the map can only be an approximation. At the same time, archaeologists have given the names of nearby modern settlements to ancient sites, which may in fact be at some distance from their modern homonym; the map shows the ancient location under its modern name.

The study of the lower course of the Bug is dominated by the city of Olbia, whose lowest parts are now under water. Like Tyras, Olbia too had another name, Borysthenes (a third name, Miletopolis, seems a rarity). The name Borysthenes is now attested there in the archaic period, on a graffito of the sixth century B.C. on an architectural terracotta (Rusyayeva 1988, 166-67), and on a bone plaque (Hind 1992, 95). Although the name was supplanted by Olbia in the city itself, it persisted in the literary tradition. Accordingly, it is used at the end of the first century A.D. by Dio Chrysostom in his *Oration 36*, a text which offers some circumstantial detail—for example, illustrating vividly the *Hylaeum Mare*—although it is not a historical description of contemporary realities (Braund 1997). Borysthenes was also the name of the great R. Dnieper, as well as evidently of the island of Berezan', whence the settlement of Olbia seems to have proceeded (Kacharava 1991, 49).

Throughout the northern area of the map, river names are a persistent source of uncertainty, all the more troubling since they are so often used by sources from Herodotus onwards as points and lines of reference (Hdt. 4.82 with RE Suppl. 9 *Pontos Euxinos*, col. 923; Corcella 1993, 275-77).

A similar source of confusion is the name of Achilles. It was applied widely in the region, where his cult was of great significance. His name is attached not only to Achilleios Dromos (“Achilles’ Racecourse,” modern Tendra), but also to the island of Leuke (off the Danube delta) whose significance was disproportionate to its size, both as a cult-center and as a port-of-call. Leuke had a particular value in any direct voyage from the Danube delta to the western Crimea (Hind 1983, 78; cf. Hind 1996). It perhaps also facilitated an alternative route from the Danube delta to the Dniester area; certainly the island could be perceived as off the Dniester rather than off the Danube (Strabo 7.3.16). It seems that the coast between the Danube and the Dniester had little to offer: here was the Eremia Geton (“Wasteland of the Getae,” Strabo 7.3.14), another coast which seems to have lost settlements to the rising waters of the Black Sea (cf. Agbunov 1981).

Two cities of the region have dominated scholarly interest, Olbia on the Lower Bug (Hypanis) and Chersonesos in the south-west corner of the Crimea. The civic territories of both, with their associated settlements, have proved particularly rewarding. The estuary of the Lower Bug around Olbia was densely settled throughout antiquity, while at Chersonesos the pre-Roman centuriation of the *chora* can even be traced in some detail (Zherebtsov 1981; Zubair 1993; Saprykin 1994). There were buildings on these plots, including tower-like structures, which came and went, though the land continued to be worked after their disuse; Kruglikova (1983) offers a detailed case-study. Nikolayenko (1988) describes such defended “villas,” and notes a preponderance towards the limits of centuriated land, as well as sites which seem to be associated with the natural defenses of the Chersonesos region, particularly the line of Khomutova Balka and Sapun Gora, the foothills of the Tauric Mountains to the east.

To the north along the coast, the *chora* of Chersonesos may have reached as far as modern Maslinyy in the Hellenistic period, much further than once thought (Treister 1993, 542-44; cf. Solomonik 1987 for epigraphy there).

The location of Karkinitis, Kerkinitis and Karkine constitutes an insoluble difficulty. The map follows the usual view that there was only one Karkinitis in the region (also known as Kerkinitis), and that this is to be located at modern Eupatoria. However, despite the strength of that orthodoxy, there remains considerable concern that Karkinitis should be located further north in the next bay of the Crimea, known today (perhaps significantly) as Karkinitskiy bay, or that the three names refer to more than one settlement. At any rate, it seems clear enough that the ancient Karkinitis Kolpos is Karkinitskiy bay and that the ancient R. Karkinites emptied into it, being the modern R. Kalanchak. Ptolemy's mention of a settlement named Karkine at the mouth of that river would account for these names, while causing least disruption to current orthodoxy. Accordingly, Karkine, which some would identify with Karkinitis/Kerkinitis, appears separately on the map (Kacharava 1991, 128-33 is exhaustive on the issue; cf. Silberman 1995, 56-57). Further south, the map adopts the orthodox locations of Parthenion Akron and the temple of Parthenos on Cape Fiolent, near St. George's Monastery. Yet Strabo's description of the area (7.4.2) seems rather to point to their location on Cape Chersonesos, the peninsula between Chersonesos and Palaia Chersonesos. Accordingly, the locations of both are presented as uncertain.

The “barbarian” peoples of the region pose a series of problems. Usually they are understood as three broad groupings, following one from another: the Scythians, replaced by the Sarmatians in the Hellenistic period, who in various guises (Alanoi, Bastarnae, Iazyges etc.) continued at the margins of the Roman empire until they were replaced by or, in some locations, evolved into the so-called “Chernyakhov culture” of Late Antiquity (see below). In addition, there are the “Thrakes” on the west of the map (Nikulitse 1987; Treister 1993b), and the Tauroi and Tauroskythai of the mountains of the southern Crimea (for their antecedents, Kris 1981; cf. Shcheglov 1988), a region known as Dory in Late Antiquity (Bortoli-Kazanski 1987; Pioro 1990).

The processes of change among the “barbarians” remain at issue: the significance of invasion may well have been overestimated at the expense of evolutionary change (see further Map 84, Introduction). Similarly, while the ethnic labels familiar in modern scholarship are those used by classical writers, archaeology may be a better guide to cultural identity. The account of Herodotus has attracted particular controversy (Corcella 1993). By and large, his text has been pressed too hard in searches for literal truth characteristic of Soviet methodology, not least for the ancient world. For example, scholars have attempted to identify Skyles' house at Olbia and the *proasteion* where he left his men in Herodotus' story (cf. Hind 1983, 81). Meanwhile, Zaginaylo (1990) seeks to argue that Skyles' authority was extensive in the north-west Black Sea (including the coastal communities) from about 475 B.C.

Archaeology shows a substantial correspondence between land-use and ecology, as might be expected. The steppe behind the north shorelands of the Black Sea was generally suited to nomadic pastoralism. Here, for the most part—the Lower Dnieper is an obvious exception which proves the rule—there were no significant Scythian settlements (as we choose to call them). Rather, such settlement was largely in the wooded steppe immediately to the north of the map, notably around the R. Vorskla towards Kiev (Pogrebova 1957; cf. Rolle 1991, 64 for the geographical and cultural lines of the steppe and woodlands to the north). It is on the western bank of the Vorskla that Bel'skoye Gorodishche is situated, identified as Herodotus' Gelonos (Shramko 1987, 21, with reference also to the settlement at Kamenskoye Gorodishche).

The relations between the “barbarians” and the classical world were a particular issue on the coastlands of the Black Sea. Certainly, there was trade: thus the “Scythian” settlement at Neapolis, near Simferopol' in the Crimean hinterland, contained considerable Greek material, including graffiti (Golentsov 1979; on Neapolis and the elusive Chabon and Palakion, see Gajdukevič 1971, 309). Moreover such trade persisted into the Roman period, as Kadeyev (1989, 80-89) indicates for Chersonesos in the south-western Crimea.

There was also mundane co-existence between “barbarians” and settlers from the classical world. For example, Okhotnikov (1990, esp. 55-63) notes the close interaction and apparent cohabitation of “Greeks,” “Scythians,” “Thracians” and others on the Lower Dniester and Danube. Marchenko constructs a similar picture for Olbia and Berezan' (1988; cf. Hind 1992, 92-94). In the Crimea, the role of the Tauroi in the early stages of Greek settlement at Chersonesos is bound up with a current dispute over the date of the city's foundation: the case for a foundation-date (however that may be imagined) in the late sixth century seems to become ever stronger as excavation continues, though the traditional date of c. 422 retains powerful adherents (note Zedgenidze 1993; cf. Hind 1992, 97-99 on the issue). Elsewhere in the Crimea, a passage of Pliny (*NH* 4.85) has caused many

imagine Scythian cities named Orgokynoi, Charakenoi, Assyranoi, Staktaroi, Akisalitai and Kaliordoi: as the names might suggest, however, these are tribes.

There seem to have been ditches at Perekop, the isthmus which connects the Crimea with the mainland (Vdovichenko 1986). Ptolemy (3.5.4) mentions a Neon Teichos in the area of Perekop, to be identified or at least associated with Taphros, situated on the isthmus (Pliny, *NH* 4.85). The geographical significance of the isthmus was evident enough, not only for military purposes but also (and perhaps more importantly) for the exaction of “taxes.” The creation of a wall and ditch there may be explained accordingly. Further, the north of Sivash (Bykes Limne), while separated from Coretus bay of the Sea of Azov by a rocky outcrop, was linked with Tamyrakes bay and the north-west Black Sea by a ditch, apparently man-made (*fossa*: Pliny, *NH* 4.84; cf. the man-made watercourse nearby, *ibid.*). This ditch may well explain the toponym Taphrai, as well as the ethnonym of the local Taphrioi. Evidently Perekop was a line of communication east-west as well as north-south.

As usual on the north and east shores of the Black Sea, the Roman, and especially the Late Roman, period has been rather neglected by comparison with earlier centuries. The Roman military presence, particularly from the late first century A.D., has attracted significant interest (note Treister 1993a; Koshelenko 1984, 57 for forts, esp. Charax). Tile-stamps indicate the activity of Roman military units (or at least the use of their products) even on the island of Leuke (Treister 1993, 533-34; cf. Hind 1983, 78 for Tyras; Avdeyev 1993 for Chersonesos). Of particular interest is the recent discovery of evidence for the production of high-quality silverware at Kara-Tobe (no. 87 on the map), perhaps for use by Roman forces in the region as diplomatic gifts in the first century A.D.

From the turn of the fourth into the fifth century, it seems, the coast and mountains between Yalta in the west and Gurzuf in the east were inhabited by people who emerge in the middle of the sixth century as the Goths of the Dory region (Vasiliev 1936, 32-38, 52-57; Kazanski 1991, 118-24). Mangup (no. 102) in the mountains may have been the center of power in Dory, though Eski-Kermen (no. 104) was also significant in the area (cf. Myts 1990 for the medieval period there, with Vinogradov 1994 and Map 84 (introduction) on links with the Aorsoi). Procopius’ (*Aed.* 3.7) account of Justinian’s constructions in the region is doubtless as over-stated as ever in his work; Late Antique remains are largely burial grounds. He claims substantial work at Chersonesos, and the creation of a fort at Alushta (Aloustou Phrourion), as well as another “among the Gorzoubitai” (the tribal name seems to survive in the modern toponym Gurzuf). He retains the ethnonyms Tauroi and Tauroskythai, but mentions also the friendly Goths of the fertile uplands of Dory, claiming that Justinian protected them with long walls across routes into their lands (*Aed.* 3.7.17).

From the end of the third century A.D., the inhabitants of the environs of such cities as Tyras and Olbia are assigned to the Chernyakhov culture (Bortoli-Kazanski 1987, 441-42). This cultural group is linked with much of the Late Antique settlement of the north Black Sea coast (Shchukin 1975; Symonovich 1979; Magomedov 1984). It is best known, however, by its burial-grounds (Kropotkin 1988; Samoylova 1989). For Late Antique coins in the region, see Kokorzhitskaya (1990), briefly supplementing Nudel'man (1976). Shchukin (1979) attempts to construct the history of the Chernyakhov culture, with its roots in that of the Sarmatians.
